PREPARING FOR YOUR CHILD'S WELL BABY VISIT: HIB VACCINE

BEFORE THE VISIT

A little research before your child's well baby visit can go a long way to reducing your stress and concerns. Credible information helps ensure healthy choices and builds vaccine confidence.

What you need to know about Hib (haemophilus influenzae)

Even though it sounds like haemophilus influenzae is in the flu family, it is a bacterium. Hib causes different types of infections ranging from mild ear infections to life-threatening blood, brain, lung, and spinal cord infections.

There are 6 different kinds of H. influenzae, A through F. H. influenzae B (commonly just called Hib) is the type that is most common and can be prevented through vaccination. Hib is spread through coughing or sneezing. Not everyone who has the bacteria will get sick, but they can still spread the bacteria.

Fast facts about the Hib vaccine

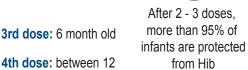

1st dose:1 month old

and 15 months of age

Hib Vaccine is a 4-dose vaccine.

Other vaccines may be given at the same time as the Hib vaccine.

Ask your health care provider what other vaccines your child will receive at the well baby visit so you can be prepared.

DURING THE VISIT

Glucose Solution

Keep it sweet. Studies show something sweet can reduce pain. Ask your health care provider to give your baby a sweet solution of sucrose or glucose one to two minutes before the shot.

Breast is best. Breastfeeding calms and helps distract your baby. Plus the close contact is very soothing. So, if you can, consider breastfeeding your baby during vaccinations.

Spray Away. Ask for a cooling spray or pain-relieving ointment, which is applied on your child's arm or leg right before vaccination. Tell your provider you want this **before** the visit so they are ready for you.

Bring a Friend. Bring your child's favorite toy, blanket or book to help them focus on something positive during the vaccination visit.

Distract Your Baby. Sing or read to you child to help them focus on you instead of the vaccination

A little planning can make a big difference in helping your child have a stress-free vaccination visit.

Congratulations for protecting your child's health and future!

We know making the best health decisions for your child can sometimes be overwhelming. We here for you. If you need more information please visit www.VoicesForVaccines.org.

WHAT TO EXPECT AFTER VACCINATION

Understanding normal immune responses vs. serious adverse events

Normal immune responses (sometimes called side effects) are how you know a vaccine is doing its job: your baby's immune system is recognizing an "invader" and preparing to fight it. But with a vaccine, it's a practice exercise and not the real thing so the immune response will usually be mild an go away on it's own in a few days. Some normal immune responses for the Hib vaccine include:

Soreness where the vaccine was given

Redness or swelling around the area where the vaccine was given

How to treat normal immune responses

The best way to treat normal immune responses to vaccination include:

- 1) Apply a cold compress to the injection site for redness and swelling.
- 2) Give your baby a pain reliever (analgesic) like Infant/Children's Motrin® or Tylenol® or equivalent generic. Call your healthcare provide for dosage.

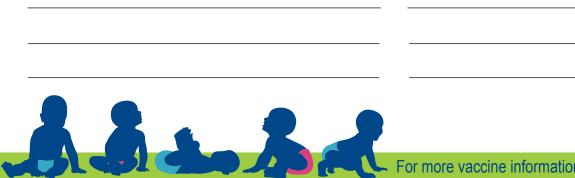

When to call your healthcare provider

Severe allergic reactions occur within second or minutes so in the extremely rare case that your child has a serious reaction, you will likely still be in the doctor's office. But more mild allergic reactions can happen several hours after vaccination (and rarely up to 24 hours later). If you notice an allergic reaction, you should contact your healthcare provider immediately.

Normal immune responses will usually go away within a week of vaccination. But if you are concerned, you should call your healthcare provider.
